

DAMOVO

Revitalise existing software with
new interfaces!

Change Driver

The new IT manager has to deal with a complex software landscape that has evolved over the last few years.

During this time many different tools have been introduced to suit the particular needs and business-critical processes of various specialist departments.

It is not currently possible to consolidate all of the software solutions into one new tool due to complexity, lack of resources and time pressure.

Damovo Approach

The Damovo solution offers a way of connecting all of the software tools in the background, presenting one uniform interface to the user.

The existing software tools are linked via API's that have been developed using a simple low code platform.

A new customized front end gives the user a simple, standard interface for all of the tools.

Different departments have access to specific software applications depending on their requirements. All this has been achieved without having to replace any of the existing software applications.

Customer Value

DAMOVO

How the IT Manager benefits

During development and testing phases there were no issues that affected current operations.

After development, testing and user training employees can seamlessly move to the new user interface - without causing any downtime. Both a “big bang” and a soft migration are possible.

In the future individual tools can be exchanged in the background without the user noticing.

How the specialist departments benefit

Each department has a specially customized modern interface that meets their requirements in terms of work processes and content.

These new interfaces offer enhanced clarity for the employees, enabling more efficient workflows, which are also reflected in higher customer satisfaction.

The user acceptance of the new solution is very high due to active employee involvement during the development phase.
